

Let guests see the dish *before they order.*

Guests scan the QR on the table and your real dishes, scanned in 3D, appear on their own table at true size. Then they order with your staff, as they always do.

How it works

1 · Scan

The QR on every table opens your menu in the browser. No app for guests to download.

2 · Tap a dish

The real dish comes into focus, and guests turn it around with one finger.

3 · See it on the table

Placed in AR at its true size. Honest portions: it can't be pinched bigger.

What stays the same

- Your waiters take the order. No online ordering or payment.
- Guests build a "show the waiter" list, notes included.
- Works in Safari and Chrome, on your restaurant wifi. The photo shows first.

What you get to see

- How many tables scanned the QR
- Which dishes guests opened
- How often a dish was placed on the table in AR
- How many lists were shown to your waiters

NO AI FOOD
Every dish is
a scan of a
real plate.
